AA003501-AA003557 represent novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) familites. The polymucleotides corrected protein kinases and the polympeptides may be used in the protein kinases and the polympeptides may be used in the protein kinases and treatment of diseases associated with the protein kinase expression. For example, they may be used to treat cancers (especially cancers of hemacopoletic origin), cardiovascular disease (e.g. atherosolerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatory disorders (e.g. diabetes), disorders (e.g. asthma), indectious disorders (e.g. hIV) and reproductive disorders (e.g. asthma), infectious Additionally, polymoleotides encoding protein kinases may be used as antiques may be used as antiques may be used as antiques in the production of antibodies against the protein kinase polypeptides may be used as antiques in the production of antibodies against the protein kinases and in assays to identify modulators of protein kinase expression and activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
syndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's disease, Theumaroid arthritis), a growth and developmental disorder (e.g. bursitis, cirrhosis, hepatitis, psoriasis, Cushing's syndrome), a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, caucher's disease). Niemann-Pick's disease). PKIN is useful in a number of drug screening techniques and to analyse the proteome of a tissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or gernline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation, inversion, corbes for mapping naturally occurring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based technologies, in PCK technologies, in dipstick, pin, multiformat enzyme linked immunosorbent (ELISA)-like assays and in microarrays utilising fluids or tissues from patients to detect altered PKIN expression. The present sequence is human PKIN-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   226 AYPGLCPPPPLESGHRSLPPSPRQRHAVRTPPRTPNIVTTVTPPGTPPMRKKNKLKPPGT 285

                                                                                                                                                                            comprises contacting a biological sample from the patient. The method comprises contacting a biological sample from the patient with proststee cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20 ETFDVMREALLRVKSSERLAMLRA------LAGMCGHRVLPGTG-----ASAIA
patient, useful for diagnosing prostate cancer (PC) or screening modulators of PC, by determining if prostate cancer-associated genes are expressed in a prostate tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications. ABG61800-ABG61944 represent prostate cancer-associated proteins.
                                                                                                                                                           The present invention relates to methods of detecting a prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila; developmental biology; cell signalling; insecticide;

ë. S 55 GTGASAIAATVTPKGAS--MKLKPPRP------OSTKSPELRELSR--KIREMNKTI 101 462 GTGTSGDRYSRSPRTSSRYMESSPPSPVGASGSHHYHHRRSPRWRQRTRGDSRRRSPSSA 521 The specification describes novel vif proteins (AAY01969-88) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce (ABBS7737-ABB72072). The sequence data form part of the printed The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. Consensus sequence; attenuated; non-functional; accessory protein; vif; New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1 11.4%; Score 80.5; DB 22; Length 1157; 28.4%; Pred. No. 17; tive 13; Mismatches 37; Indels 13; Disclosure; SEQ ID NO 16845; 21pp + Sequence Listing; English. HIV-1 viral infectivity factor protein N23. This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a polypeptide described in the disclosure of the invention.

immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral escape and contribute to lowering the viral set point during early infection stages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids having the sequences of clones isolated from libraries of different human tissues, useful in recombinant DNA methodologies -

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, mimunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. WPI; 2001-639362/73. N-PSDB; AAS82497 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colopymers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques contention for the restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving anticitating an polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in capposite, for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and confidence other types of data and products dependent on DNA and amino acid sequences of the invention.

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations

us-10-06/-5/5-2.rag

70.70.01 T2 VON 111

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCRN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical inacides involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human one sequence data for this patent did not appear in the printed sequence amino acid sequences of the invention.

New immunoreactive HTLV-III polypeptide expressed by transformed cells - and derived antibodies, useful for diagnosis of AIDS and in active or passive immunisation

Disclosure; Fig. 3; 60pp; English

HIV virus cDNA is cleaved with restriction endonucleases to produce the gag protein. The resulting protein and antibodies against it are useful for immunoassay of HIV virus, e.g. by sandwich type RIA. The protein may also be used in vaccines for active immunization. See also AAP60346-7 and AAP60349.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

Disclosure; SEQ ID NO 31194; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

The invention provides protease inhibitors which inhibit lentiviral or retroviral replication where the inhibitor comprises an amino acid sequence which corresponds to an amino acid sequence in a lentiviral Vif protein. The protease inhibitors can be used for the prevention or treatment of lentiviral or retroviral infection, e.g. those resulting from HIV-1, HIV-2, simian immunodeficiency virus, bovine immunodeficiency virus, bovine immunodeficiency virus, bovine immunodeficiency virus or also used in such methods. The present sequence represents an example of a peptide inhibitor of the invention derived from the HIV-1 Vif protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          22 FDVMREALLRVKSSERLAMLRALAG------MCGHRVLPGTGASAIAATVTPKGASM 72

seguences (ABL01840-ABL16175) and the encoded proteins

26-SEP-1997; 18-SEP-1997; WO9913896-A1 25-MAR-1999 25-MAR-1999 158 Claim 2; Sequence AAY01978 q ò ò The specification describes novel vif proteins (AAY01969-88) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HY-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vif genes may be used in concert with other HIV-1 genes to produce components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral escape and contribute to lowering the viral set point during early infection stages. 22 FDVMREALLRVKSSERLAMLRALAGMCGHRVLP----GTGAS-----AIAATVTPKG 69 Consensus sequence, attenuated, non-functional, accessory protein, vif, viral infectivity factor,  ${\rm HIV}\textsc{-}1$ ; vaccine. 38; Gaps New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1 70 ASMKLKPPRPQSTKSPELRELSRKIREMNKTISQESARVNHRLPEGH 116 ---KIKPPLPSVRKLTEDR------WNKPQKTKGHRGSHTM-NGH 192 Query Match 10.9%; Score 77; DB 20; Length 192; Best Local Similarity 29.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes novel vif proteins (AAV01969-88) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in munize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce components, and which maincs many aspects of the immune response induced by a live attenuated virus. Prophylactic vaccines which include virus escape and contribute to lowering the viral set point during early infection stages.

9 22 FDVMREALLRVKSSERLAMLRALAGMCGHRVLP----GTGAS------AIAATVTPKG 69 gene The specification describes novel vif proteins (AAV01969-88) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, nor functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, nor-functional vif genes may be used in concert with other HIV-1 genes to produce vacine that has a broad immune response against all viral components, and which minics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vifuculd limit both viral escape and contribute to lowering the viral set point during early infection stages. The wif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional wif clones are able to induce immune responses capable of destroying native pathogen. Wif nucleic acids may be used to immunize memmals. The attenuated, non-functional wif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include wif could limit both viral secape and contribute to lowering the viral set point during early infection stages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Consensus sequence; attenuated; non-functional; accessory protein; vif; viral infectivity factor; HIV-1; vaccine.

New attenuated vif (viral infectivity factor) genes, used in genetic vaccines against HIV-1

WPI; 1999-263380/22. N-PSDB; AAX35218.

Claim 2; Fig 7A; 92pp; English

ý

69

The specification describes novel vif proteins (AAY01969-88) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagemicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vif genes may be used a munne response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-1 that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Wif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral scape and contribute to lowering the viral set point during early infection stages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antigenic composition comprising an isolated primate lentivirus whose genome contains an engineered non-revertible null mutation in the nef gene, or an infectious DNA clone in a carrier. The antigenic composition is used in vaccines against infection by the lentivirus, e.g. AIDS.
vif could limit both viral escape and contribute to lowering the viral set point during early infection stages.

20-AUG-1991 (first entry)

The invention relates to a peptide fragment comprising of amino acid sequences corresponding to sequences within the processed gp120 of HIV-1 isolate BHIO (Genbank accession M15654). The peptides are useful in the detection, prevention and treatment of HIV-1 infections, and in AIDS therapy. The antibodies are especially useful as vaccines for active and passive immunization, or for the detection and/or determination of HIV-1 infected cells and/or HIV-1 viruses. The present sequence represents the (GenBank accession M15654). New anti-idiotypic antibodies consisting of one or both amino acid sequences corresponding to amino acid positions 79-84 or 326-400 of the processed gpl20 of HIV-isolate BH10, useful as vaccine against HIV-1 , Buchacher A, Ernst W, Ballaun C, Purtscher M; Predl R, Schmatz C, Klima A, Steindl F, Muster T; 158 KIKPPLPSVTKLTEDR------WNKPQKTKGHRGSHTM-NGH 192 HIV-1; gpl20; BH10; vaccine; immunization; vif protein Amino acid sequence of HIV-1 isolate BH10 vif protein. Purified glyco:protein and peptide(s) - are recognised by sera contg. antibodies against lymphadenopathy virus and useful in detecting AIDS antibodies or in vaccines The inventors claim a polypeptide which is recognised by sera of human origin contg. antibodies against the virus of lymphadenopathies (LAV) or acquired immune deficiency syndrome (AIDS). ABCO claimed are various peptides corresp. to the AA sequences deducible from proteins encoded by LAV DNA, defined by specific residues (e.g. 12-32, 37-46, 49-79, 88-153) in accordance with a formula given in the specification.

FDVMREALLRVKSSERLAMLRALAG-----MCGHRVLPGTGASAIAATVTPKGASM 72 A fragment of DNA approximately 200-500 base pairs in length is ligated into a vector and used to transform E.coli. These cells then express a polyapetide which is immunoractive with HTLV-III-specific antibody. The HTLV-III polypeptides can be used for the production of antibodies, in immunoassays for the detection of HTLV-III specific antibodies and in vaccines for the prevention of AIDS. The antibodies can also be used to detect HTLV-III polypeptides. (Updated on 25-MAR-2003 to correct PM field.) ```
The present invention relates to a chemically synthesised env peptide of Human Immunodeficiency Virus (HIV) of less than 150 amino acid residues. Such a peptide is useful in an in vitro diagnostic method for the catching the persence or absence of antibodies that bind to antigens of HIV-1 retrovirus, by contacting the peptide with a biological fluid for form a peptide-antibody complex, detecting the formation of the peptide-antibody complex by comparing the formation of the peptide-antibody complex formation with a control sample, where the peptide-antibody complex is correlated with the presence of antibodies that bind to antigens of HIV-1 retrovirus in the biological sample. It can also be used for preparation of vaccine compositions against AIDS or related syndromes. The present sequence is the lymphadenopathy-associated virus LAVORE Q protein. The LAV virus was insolated from a patient with AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22 FDVMREALLRVKSSERLAMLRALAG------MCGHRVLPGTGASAIAATVTPKGASM 72

Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.

Example 1; Page 747-748; 799pp; English

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively. AAB63246 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63300 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,

Nucleic acids encoding histone fusion proteins useful for the prevention, diagnosis and treatment of disorders associated with cell proliferation and inflammation -

Claim 1; Fig 1; 29pp; English.

This sequence represents human histone fusion protein HHFP. Nucleic acids encoding HHFP were first identified in a human breast tissue CDNA library and this sequence represents a consensus. HHFP is a naturally occurring protein which contains regions homologous with both histones and nonhistone proteins. The N-terminus of HHFP resemble the full-length human histone H2A, while residues 133.161 are highly basic and have similarity with the C-terminus of histone H1, indicating that HHFP has DNA binding potential. There is a leucine zipper region in the

**UB-TO-08/--2/80-0T-8D** 

82 TKSPE-----LRELSRKIREMNKTISQESARVNHRLPEGHPLLEKRAEYFR 127 nonhistone region of HHFP (between residues 183 and 213) indicating a potential transcription-regulating function. HHFP has structural and fuctional homology with mHZA, a rat histone-nonhistone fusion protein identified in rat liver nucleosemes. HHFP and nucleotides encoding in may be used in the diagnosis, prevention and treatment of disorders associated with cell proliferation (especially cancers) and inflammation (e.g. AIDS, asthma and multiple sclerosis. They may also be used to downregulate histone activity and therefore reduce rates of cell proliferation and reduce inflammatory reactions. 26 REALLRVKSSERLAMLRALAGMCGHRVLPGTGASALAATVTPKGASMKLK----PPRPQS 81 Length 373; DB 20; Query Match 10.8%; Score 76.5; DB 20; Best Local Similarity 23.3%; Pred. Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy .

Claim 20; Page 258-259; 6221pp; English.

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to erytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

A fragment of DNA approximately 200-500 base pairs in length is ligated into a vector and used to transform E.coli. These cells then express a polyapptide which is immunoreactive with HTLV-III-specific antibody. The HTLV-III polypeptides can be used for the production of antibodies, in immunoassays for the detection of HTLV-III specific antibodies and in vaccines for the prevention of AIDS. The antibodies can also be used to detect HTLV-III polypeptides. (Updated on 25-WAR-2003 to correct Pfield.)

Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.

Example 1; Page 701; 799pp; English.

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively. AAB63467, AAB63468 to AAB63121 and AAB63722 to AAB63467, AAB63468 to AAB63121 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein, e.g. cancer.

23-MAR-2001; 2001WO-US09231.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL6175) and the encoded proteins 287 SNOEPATPISLAGSCGVNYIVLDLDQPRSPVGPAGSSKAINGFGSGLSLISTPAAVTAPV 346 -----SAIAAIV 65 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. ```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating apolypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucletide sequences have applications in the printed of diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and produces dependent on DNA and confidence other types of data and produces dependent on DNA and diagnostic amino acid sequences of the invention.

The invention comprises a method for detecting an androgen-independent cancer cell in a sample from a patient who has undergone androgen ablation therapy. The method involves determining the presence or absence of nucleic acids that are either up-regulated or down-regulated in prostate cancer. The method is useful for detecting an androgen-independent prostate cancer cell in a sample from a patient who has undergone androgen ablation therapy. The method is particularly useful for diagnosing androgen-dependent prostate cancer, prostate cancer undergoing androgen withdrawal, or androgen-independent prostate cancer. The present amino acid sequence represents a protein which is encoded by a gene that is either up-regulated or down-regulated in prostate cancer.
                                                                                                                                                                                                                                                                                          Detecting an androgen-independent prostate cancer cell in a sample diagnosing androgen-dependent prostate cancer, by determining the presence or absence of genes whose expressions are up- or down-regulated -

Drosophila melanogaster

WO200171042-A2

23-MAR-2001; 2001WO-US09231

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLI6175 ABL30511), expressed DNA sequences (ABL01817), and the encoded proteins
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: A0908-136
TITLE OF INVENTION: A0908-136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT PILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PELICATION NUMBER: US 60/094,190
PRIOR PELICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEGO ID NO 32190
LENGTH: 231
APPLICANT: Marc J. Rubenfield et al.

Sequence 30436, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICATION NUMBER: US/09252991A
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: NUMBER: US/09/252,991A
CURRENT APPLICATION NUMBER: US/09/074,788
PRIOR PLILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142
LENGTH: 329
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: 1999-02-18

Sequence 19038, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

TITLE OF INVENTION: WUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PILING DATE: 1998-07-27

WUMBER OF SEQ ID NOS: 33142

SEQ ID NOS: 33142

1 Patent No. 6551795
1 GENERAL INFORMATION:
1 APPLICANT MACE J. Rubenfield et al.
1 TILE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
1 TILE REPERENCE: 107196.136
1 CURRENT APPLICATION NUMBER: US/09/252,991A
1 CURRENT FILING DATE: 1999-02-18
1 PRIOR PAPLICATION NUMBER: US 60/074,788
1 PRIOR PLICATION NUMBER: US 60/094,190
1 PRIOR PLICATION NUMBER: US 60/094,190
1 PRIOR PLICATION NUMBER: US 60/094,190

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

related to TOM1 protein [imported] - Neurospora crassa
NyAlternate names: protein B11B22.10
Sybedess Neurospora crassa
C;Species Neurospora crassa
C;Species Neurospora crassa
C;Species: Neurospora crassa
C;Species: No. 149799
Sybodes: 02-Jun-2000 #sequence_revision 02-Jun-2000 #text_change 02-Jun-2000
C;Accession: T49799
Sybodes: 01-3 Aign, V.; Hoheisel, J.; Brandt, P.; Fartmann, B.; Holland, R.; Nyakaturrs submitted to the Protein Sequence Database, May 2000
A;Reference number: 255022
A;Accession: T49799
